

Project Design Phase

Proposed Solution Template

Date	03 October 2026
Team ID	SWTID-2026-6763
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The Incident management process in ServiceNow requires users and service-desk agents to enter accurate information while creating and updating incident records. When the form does not respond dynamically to user selections, important fields may remain empty, unnecessary fields may be editable, and users may enter incomplete or inconsistent data. This can increase manual effort, reduce the quality of incident records, and create additional work for support teams during incident analysis and resolution. The project aims to address these issues by introducing dynamic form behavior through Client Scripts and UI Policies on the Incident table.
2.	Idea / Solution description	The proposed solution implements ServiceNow Client Scripts and UI Policies to control the behavior of the Incident form according to defined conditions. UI Policies are used to make fields mandatory, optional, visible, hidden, or read-only when particular conditions are satisfied. Client Scripts provide additional client-side functionality, such as responding immediately when a field value changes, setting or clearing field values, validating information entered by the user, and displaying appropriate messages. The combined solution provides a guided Incident form that helps users enter the required information correctly and reduces repetitive manual actions during incident creation and update.
3.	Novelty / Uniqueness	The solution combines the declarative capabilities of ServiceNow UI Policies with the flexibility of Client Scripts to create an interactive Incident form. UI Policies can handle standard field-state requirements without unnecessary scripting, while Client Scripts can manage conditions that require dynamic client-side processing. This approach keeps the customization within the ServiceNow platform and avoids dependence on external applications or complex custom solutions. The configuration can also be maintained and modified independently as Incident-management requirements change.
4.	Social Impact / Customer Satisfaction	The solution improves the experience of users and service-desk agents by guiding them through the Incident form and reducing confusion about which information is required. Mandatory-field controls and client-side validation help prevent incomplete submissions, while dynamic visibility and read-only behavior allow users to focus only on relevant information. Better-quality incident records can provide support teams with clearer information for investigation, communication, and resolution, helping create a more consistent and efficient service experience.
5.	Business Model (Revenue Model)	The project follows an internal operational-efficiency model rather than a direct revenue-generation model. It uses existing ServiceNow functionality to improve the Incident-management process, reduce repetitive data-entry work, and improve the consistency of information captured in incident records. By reducing avoidable manual activities and improving the quality of submitted incidents, organizations can make better use of their service-desk resources and reduce administrative overhead without requiring a separate external application.
6.	Scalability of the Solution	The solution is scalable because additional UI Policies and Client Scripts can be introduced as the Incident-management process becomes more detailed. Conditions can be configured for different categories, priorities, services, assignment requirements, or other Incident fields. The same approach can also be adapted to other ServiceNow forms where dynamic field behavior is required. As the number of incidents and service-desk users increases, the configured form logic continues to provide consistent guidance without requiring a proportional increase in manual data-entry or form administration.
