Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Empathy Map

An empathy map is a simple visual tool used to understand the experiences, needs, behaviours, and challenges of users interacting with a system. It helps the project team view the problem from the user's perspective. For the **Implement Client Script & UI Policy (Incident)** project, the empathy map helps us understand the difficulties faced by service desk agents and ServiceNow administrators while creating, updating, and resolving incident records. Understanding their expectations and challenges helps us identify the actual problems caused by missing, incorrect, or inconsistent data on the incident form and design a solution using **Client Scripts** and **UI Policies** in ServiceNow. This ensures that mandatory details are captured, fields behave correctly, and the overall incident handling experience improves.

Example:

Empathy Map

Implement Client Script & UI Policy (Incident) in ServiceNow

Example: IMPLEMENT CLIENT SCRIPT & UI POLICY (INCIDENT) IN SERVICENOW
