Customer Problem Statement

Incident users need a consistent and guided way to create and update Incident records. Without appropriate client-side rules, users may enter incomplete or invalid information, edit fields that should be protected, or miss fields that are required only under certain conditions. The Implement Client Script & UI Policy (Incident) project addresses this by using Client Scripts for validation and automatic client-side actions, and UI Policies to control field visibility, mandatory status, and read-only behavior according to Incident conditions. This helps reduce data-entry errors, improve consistency, and make incident handling more efficient.

Example:

Problem Statement Structure:

I am an Incident user → I'm trying to enter and update accurate information →

But field rules are not always conditional or consistent → Because Client Scripts and UI Policies must control validation and form behavior → Which makes me feel frustrated when rework is required.

Problem Statements (PS)

Statement (PS)	Customer	I'm trying to	But / Because	Which makes me feel
PS-1	An Incident creator or fulfiller.	enter correct details and update the record quickly.	Fields may need conditional validation, mandatory, visible or read-only behavior.	Frustrated when incorrect or incomplete data causes corrections and delays.
PS-2	A service desk team handling Incident records.	keep form behavior consistent across different conditions.	Without client-side rules, users may miss required information or edit protected fields.	Concerned about inconsistent records, rework and slower processing.
